Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence encodes the mature protein of an antifungal polypeptide (AlyARP) isolated from plants of the genus Alyssum. The sequence was PCR amplified using primers AAT94583-194584, and the resultant 264 bp fragment was cloned as a BamHI fragment into the expression vector pMONI23317 to generate plasmid pMONI2552. The AlyARP sequence in this

plasmid is placed under control of an E35S promoter and the maize HSP70 intron I sequence. The protein can be used to control phytopathogenic fungi, whilst the DNA can be used to produce transgenic plants that express the protein making them resistant to the phytopathogenic fungi
                                                                                                                                                                                                                     GGGAATTCGGATCCAAGAAAGTAATAGATATGGCTAAGTTTGCTACCATCATCTCTTC

                                This sequence represents the cDNA sequence cloned into the E. coli cassette vector pMON23317 to generate vector pMON22652. The cDNA encodes the antifungal polypeptide AlyAFP, isolated from plants of the genus Alyssum. The AlyAFP polypeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic
                                                                                                                                                                                                                                                                                                                                                        AGAAACCTIGAAAGAGCAGAACACGGAICTIGCAACTAIGTCTICCCAGCICACAAIGT 248

This sequence represents the cDNA sequence encoding the antifungal polypeptide AlyAFP, from plants of the genus Alyssum. The sequence represents a composite of the sequences isolated by 5' and 3' RACB (Rapid Amplification of cDNA Ends) methods (see AAT94577 and AAT94580). The AlyAFP polypeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       230 CAGAAACCTIGAAAGAGCAGAACACGGATCTIGCAACTAIGTCTICCCAGCTCACAAAIG

                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                        This sequence represents the cDNA sequence which encodes the antifungal polypeptide AlyAFP, isolated from plants of the genus Alyssum. The AlyAFP polypeptide can be used to control phytopathogenic fungii, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic fungi

This sequence is the product of the amplification of the 5' region of the antifungal polypeptide AlyAFP, isolated from plants of the genus Alyssum, by a 5' RACE (Rapid Amplification of cDNA Ends) using priners AAT94575-194576). The AlyAFP polypeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This cDNA represents the sequence of Rs-AFP1 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and digoxigenin-11-dUTP instead of dTTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII cDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage R408. Inserts from 22 positive clones were excised by BcRI digestion and their size compared by agarcase gel electrophoresis. Four clones had insert sizes of approx. 400bp the others between 250-300bp. The inserts of the 4 largest clones were then sequenced and found to differ only in the length of their 5, and 3, VTR's. The longest sequence is given here. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                             Plant-derived antimicrobial proteins are expressed in endosymbiotic clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFPI from R. sativus. The full-length CDNA sequence of Rs-AFPI is given in AAQ70128. (Updated on 25-MAR-2003 to
                                                                                                                                  Antimicrobial protein producing endo-symbiotic microorganisms - is produced by combining nucleic acids encoding the protein with an endophyte, useful for protecting plant hosts from esp. fungal disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80 CTTTGCTGCCTTTGAAGCACCAACAATGGTGGATGCA---AGGTTGTGCGAGAGACCAAG

```
Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.
                                                                         Puijk WC, Schaaper WMM,

(AAM12281), have also been produced (see AAW19282-92, AAW19294-98,
AAW19301-04, AAW19303-34 and AAW1765-8131. Platus containing DNA
sequences encoding these proteins have improved resistance to fungi.
Compositions containing the peptides can be used to control fungi or
bacteria in pharmaceutical (e.g. treatment of Candida infections) or
preservative purposes (as food additives). In agriculture, the peptide
may be used to improve disease resistance or disease tolerance of crops
either pre or post harvest. When applied to plants they may also have CTITIGCTGCCTTTGAAGCACCAACAATGGTGGATGCA---AGGTTGTGCGAGAGACCAAG 66 ritriciocitricca accacca acta a recica a caca a caca a constructor a caca a constructor a caca a TGAAAGAGCAGAACACGGATCTTGCAACTATGTCTTCCCAGCTCACAAATGTATTTGTTA Gaps This cDNA sequence encodes an Rhapanus sativus (radish) antifungal 3; Length 414; 37; Indels Sequence 414 BP; 128 A; 74 C; 80 G; 132 T; 0 U; 0 Other; Score 178.8; DB 2; Pred. This cDNA clone codes for the preprotein for radish antifungal protein 1 (Rs-AFP1) (AAW19617). Novel antifungal proteins are based on Rs-AFP1, Rs-AFP2 (see AAW19616), Rs-AFP3 and Rs-AFP4, especially those in which Gly9 is repaced by Arg, Val39 by Arg, Gly9 by Arg, Glu5 by Met and/or Gly16 by Met. Mutants (see AAW26371-90) of Rs- AFP2 are specifically claimed. The mutants show improved salt tolerant antifungal activity, particularly 136 80 CTTTGCTGCCTTTGAAGCACCAACAATGGTGGATGCA---AGGTTGTGCGAGAGACCAAG Triridericirirea Accaeca a regio de a accae a a como como a TGAAAGAGCAGAACACGGATCTTGCAACTATGTCTTCCCCAGCTCACAAATGTATTTGTTA redesacarecresesacresesacianas de la redesación de la rede 6 Arragidarcardadriaderridecarccardadecacritringergererrer New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents. The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Butrema wasabi (Wasabia japonica) gamma-thionin protein from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 TITGAAGCACCATCAATGGTGGAAGCGCAGAAGTTGTGTGCGAGAAGTCAAGTGGGACATGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               254
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence encodes the Arabidopsis PDF1.1 gene which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 78

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Butrema wasabi (Wasabia japonica) gamma-thionin protein from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        90 TITGAAGCACCAACAATGGTGGATGC---AAGGTTGTGCGAGAGACCAAGTGGGACATGG 146

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 14, Application US/09829381D
Patent No. 6653280
Patent No. 6653280
Patent No. 6653280
Patent No. 6653280
APPLICANT: Shah, Dilip M.
APPLICANT: Shah, Dilip M.
APPLICANT: Rosenberger, Clindy A.
TITLE OF INVENTION: Antifungal Polypeptide ALYAFP from Alyssum and Methods for Control TITLE OF INVENTION: Plant Pathogenic Fungi
FILE REFERENCE: 38-21 (10700) C
CURRENT APPLICATION NUMBER: US/09/829,381D
CURRENT FILING DATE: 2001-04-09
PRIOR APPLICATION NUMBER: 09/103,489
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           69 GCTCTTGTTCTCTTTGCTGCCTTTGAAGCACCAAAAATGGTGGATGCAAGGTTGTGCGAG 128

Patent No. 6215048
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Idan, Dilip M.
APPLICANT: Shah, Dilip M.
APPLICANT: Rosenberger, Cindy A.
TITLE OF INVENTION: Controlling Plant Pathogenic Fungi
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: Charles E. Cohen, Monsanto Company, BB4F
                                                                                                                                                                                                                                                              E: Charles E. Cohen, Monsanto Company, BB4F
